

StopLight™

Network Infrastructure Cyber Security Solution

Prevents the Loss of Classified Data in Secure Infrastructures

The need for access to classified information has grown exponentially over the last 10 years while the budgets and resources available to support such growth has steadily declined.

Protecting classified information in large-scale government facilities and meeting CNSSI 7003 requirements for testing and inspecting secure infrastructures has become extremely challenging. If you are one of the Information Assurance and/or Security Managers currently utilizing Alarmed Carrier PDS to secure classified information, you're most likely finding it increasingly difficult to dedicate the necessary resources to maintain your secure networks.

CyberSecure IPS offers solutions for the most common challenges facing the owners of Alarmed Carrier PDS systems today:

- ▶ Periodic Tests/Inspections
- ▶ Alarm Response Management
- ▶ Standard Operating Procedures
- ▶ Alarm Notification
- ▶ After Hours Alarm Responses
- ▶ Disturbance Severity
- ▶ Regional Management

CyberSecure IPS StopLight™

Centrally Managed Infrastructure Protection System

Deployed worldwide to protect classified information requiring data shut-off and periodic alarm testing at every building.

Disables Data by Stopping the Light

StopLight™ is integrated with CyberSecure IMS™, the world's first Unified Cyber-Physical Protection platform, capable of detecting intrusion attempts with integrated software and hardware controllers to disable data and determine the severity of each event in real time.

Automated Periodic Inspections

StopLight™ automates 100% of the periodic inspections associated with Alarmed Carrier PDS in any size building.

StopLight™ Features

StopLight™ is a remotely configurable fiber optic panel designed specifically to integrate into large-scale Alarmed Carrier PDS facilities to enhance performance, reliability and security. The StopLight™ solves many of the day-to-day challenges currently facing customers who previously deployed Alarmed Carrier PDS and have experienced a reduction in resources.

- ▶ Software Controlled Automated Periodic Testing of up to 100% of the Alarmed PDS Fibers
- ▶ Software Controlled On/Off Switch per Port to Disable Classified Data After Hours
- ▶ Automated/Customized Periodic Test Reports Mailed Out After Each Periodic Test Period
- ▶ Capable of Random Scheduled Testing at any Periodic Interval
- ▶ Supports Single-Mode and Multi-Mode Fiber Interfaces
- ▶ Uses Micro Electro Mechanical System Technology to Simulate Fiber Damage During Testing
- ▶ Available in Increments of 8 Ports
- ▶ Centrally Managed by CyberSecure IMS™
- ▶ Out-of-Band & Non-Intrusive Solution

StopLight™ reduces on-going maintenance costs and eliminates the need for personnel to perform and document periodic inspections for any size building. It also simplifies alarm response management by having the ability to disable alarmed traffic after hours while continuing to monitor the Alarmed PDS network.
